

TDM - How To use drag and drop
within the template editor

Introduction

From version 4.1 and higher it is possible to drag and drop images into the template editor. This way your images will automatically be converted into elements and added into your design.

This guide explains how the drag and drop functionality can be used.

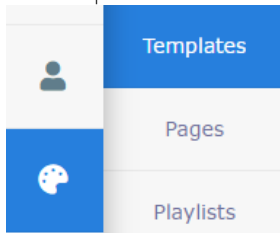

Requirements

If you want to use drag and drop you need to meet the following requirements:

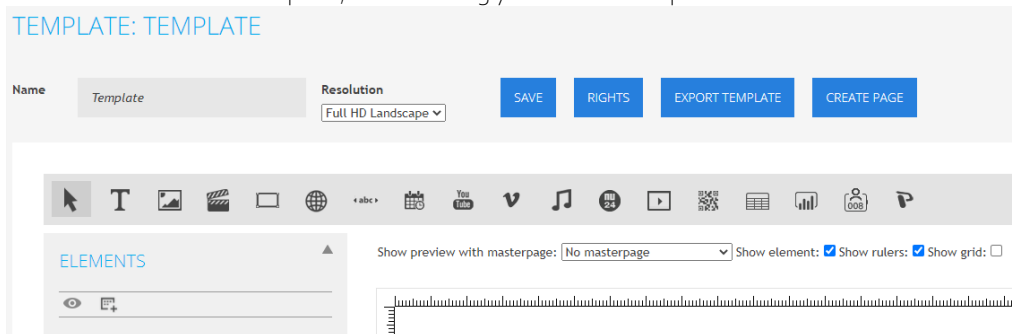

- Have access to the template editor.

How To use drag and drop within the template editor

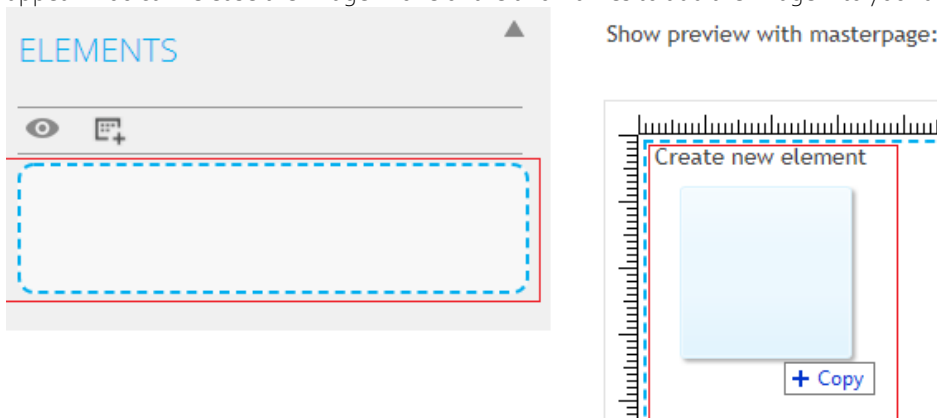

1. Please open "Content Creation" from the menu on the left side and select "Templates".

2. Please create or edit a template, this will bring you into the template editor.

3. Please select the image on your local machine and drag this into the template editor, you will see that two blue frames will appear. You can release the image in one of the two frames to add the image into your design.

4. Once the image has been released into the template an element will be created and the image will appear in the top left corner of your design. From there you can drag it to your desired position and resize it if necessary.

Once you reach this step you have successfully added your image using drag and drop, you can repeat these steps in case you want to add multiple images into your design.
